WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (i).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e. morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental U.S. properly classifiable as battle casualties.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Readers are cautioned not to use the deaths from injury or the deaths from all causes shown in these reports as accurate indications of mortality.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a

strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Normal bed capacity as shown in this report excludes normal tentage beds and beds in convalescent facilities. For definitions of normal bed capacity etc. see paragraph 36b of AR 40-1080, 10 December 1943 and paragraph 14, WD Circular No. 43, 1 February 1944. Total beds include all expansion beds in fixed and non-fixed hospitals, and normal tentage beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 17 MARCH 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes, from disease and from injury all increased fractionally during the week ending 17 March 1944. The admission rate from all causes was reported at 721 per year per thousand, while the admission rate from disease was reported at 652 per year, both being about 28 percent below the corresponding rates for the week ending 18 March 1943. Despite a slight increase in the admission rate, injuries continued on the low level prevailing in recent months.

Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 17 March 1944 was reported at 219 per year per thousand, or about 6 percent lower than for the preceding week. Since about the middle of January 1944 morbidity from colds, influenza, etc. has been about 35 percent under that recorded for the corresponding period of 1943. The morbidity from all forms of pneumonia remained substantially the same as during the preceding week and about 25 percent under the rate for the corresponding week of 1943.

Common Communicable Diseases:

New cases of measles increased sharply almost to the record figure reported for the week ending 3 March 1944. New cases of mumps registered a sizeable drop. New cases of scarlet fever and meningitis were also reported lower. The number of new cases of rheumatic fever increased to the highest weekly total reported during the last six months.

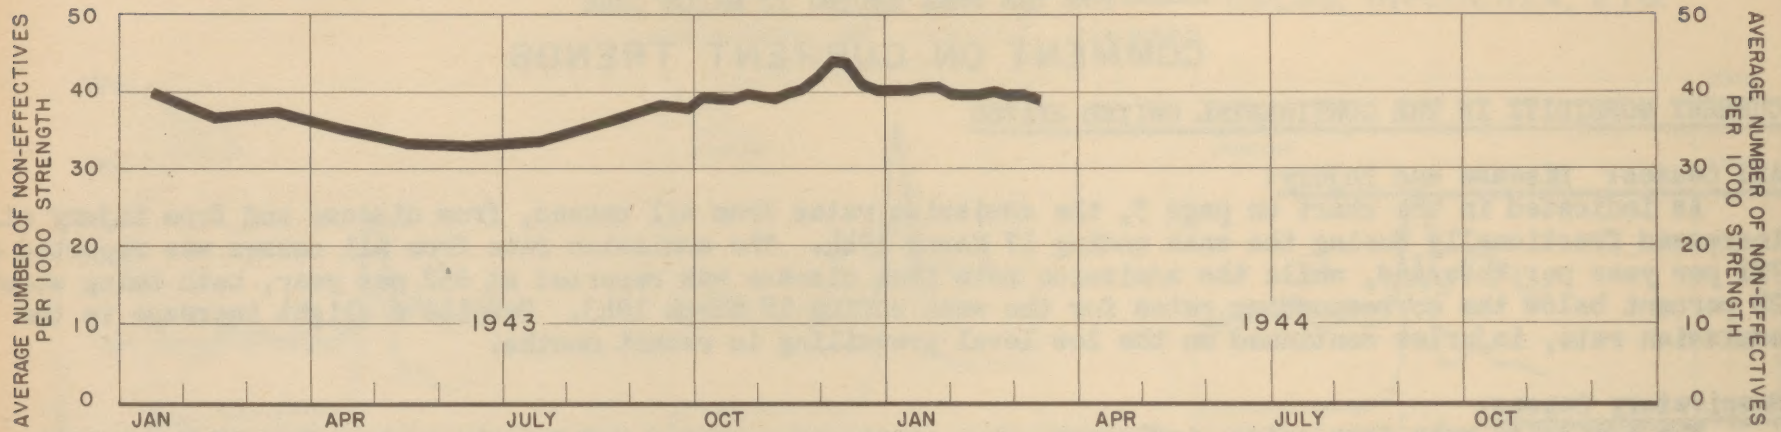

VARIATIONS IN MORBIDITY BY SERVICE COMMAND:

All Causes: Disease and Injury:

The Second Service Command reported a sharp increase in morbidity from all causes and from disease. The sharp increase in the admission rate from disease in this Service Command was largely accounted for by higher morbidity from respiratory causes and from venereal diseases. Slight increases in morbidity from disease were registered in the First, Seventh, and Ninth Service Commands. The Military District of Washington showed a sizeable decrease in morbidity from disease but an increase in admissions from injury. The Second Service Command experienced the highest admission rates from all causes (945 per thousand) and from disease (885 per thousand) while the Eighth Service Command continued to report the lowest morbidity from all causes (617 per thousand) and from disease (546 per thousand).

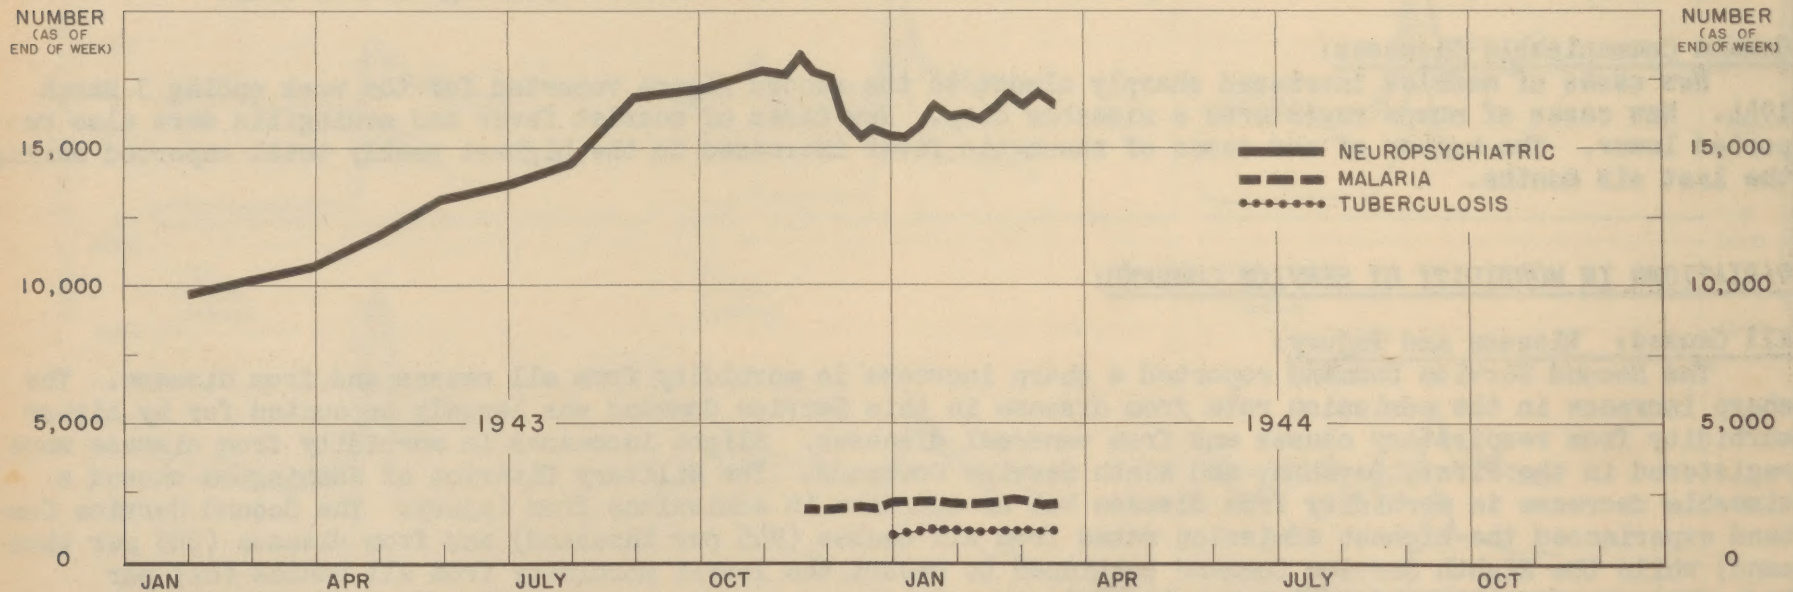

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 17 MARCH 1944

COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

All Service Commands except the Second reported lower admission rates from colds, influenza, etc. The largest decreases in morbidity from colds, influenza, etc. occurred in the Fifth Service Command and the Military District of Washington. The Sixth Service Command continued to experience the highest morbidity from these causes (409 per thousand), while the lowest admission rate (151 per thousand) was again reported by the Eighth Service Command. The Military District of Washington showed a sharp increase in morbidity from pneumonia, with the highest rates being reported by the Seventh and Sixth Service Commands as well as the Military District of Washington.

Common Communicable Diseases:

A very sharp rise in morbidity from venereal disease (excluding EPTS cases) was reported in the Second Service Command, which as a result showed the highest morbidity from these causes (45 per thousand) for the week ending 17 March 1944. A large proportion of the new cases of venereal disease (excluding EPTS) were among task force troops not under the jurisdiction of the Second Service Command. An increase of more than 100 in the number of new cases of measles in the Seventh Service Command (Ft. Snelling and Camp Savage) accounted for the entire increase in the number of new cases of measles in the country. The numbers of new cases of measles and of mumps in the Fourth Service Command dropped sharply; the decrease in the latter more than accounted for the entire decline in the number of new cases of mumps in the country. New cases of rheumatic fever increased in the Sixth, Seventh, and Eighth Service Commands.

NON EFFECTIVE RATE:

The non-effective rate declined slightly for the third successive week and was reported at 38.9 per thousand strength for the week ending 17 March 1944.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity by Service Command as the different numbers of General Hospitals in each Service Command. When comparisons are made between the non-effective rates for each of the Service Commands excluding General Hospitals, the variations are seen to be very much smaller than when the days lost in General Hospital are included.

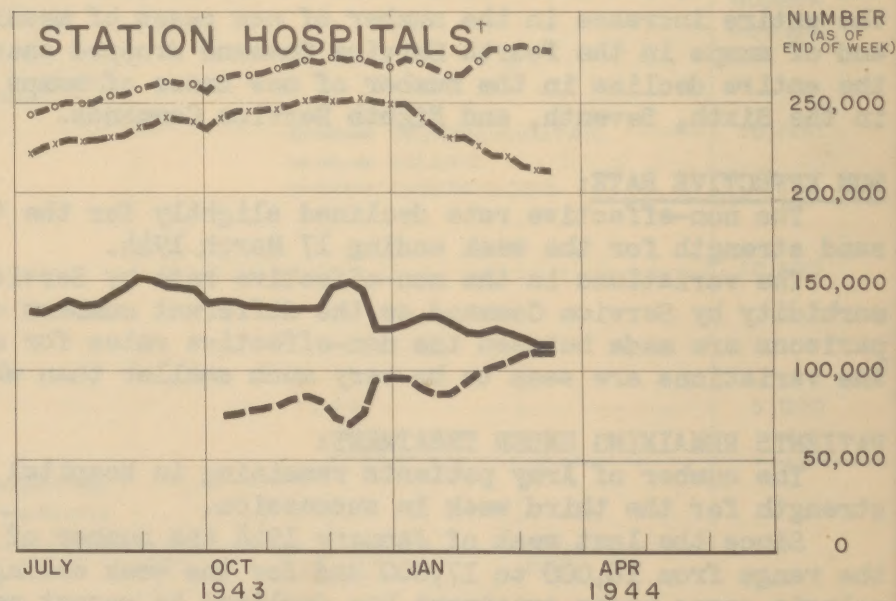

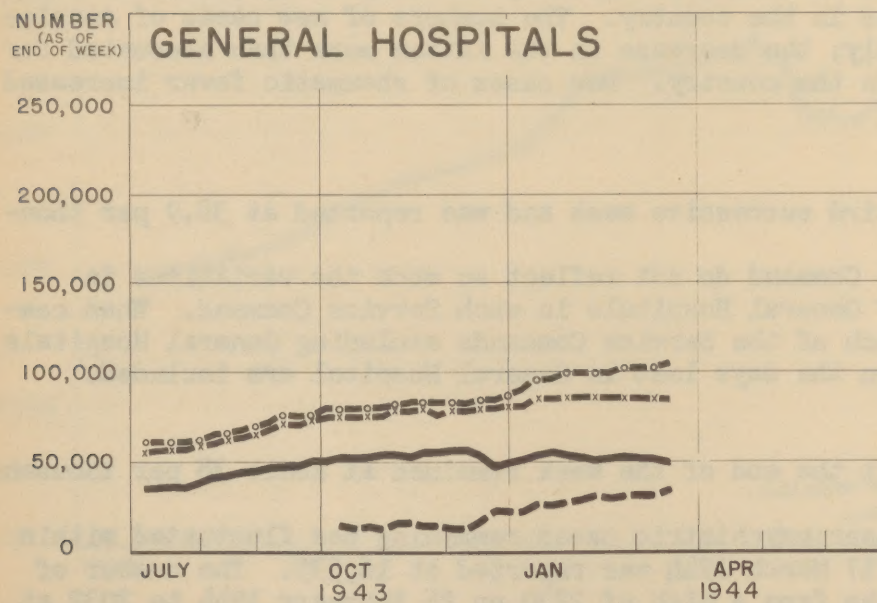

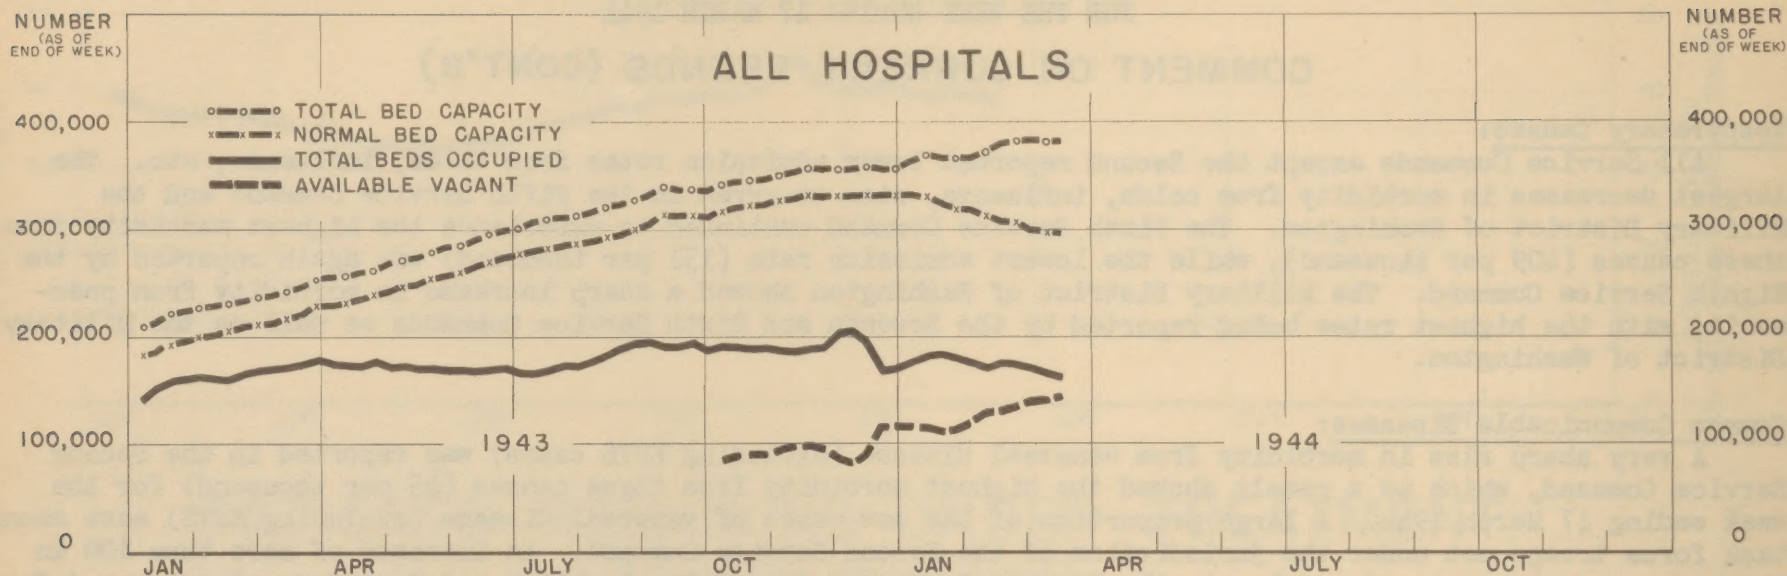

PATIENTS REMAINING UNDER TREATMENT:

The number of Army patients remaining in hospital at the end of the week remained at about 38 per thousand strength for the third week in succession.

Since the last week of January 1944 the number of neuropsychiatric cases remaining has fluctuated within the range from 16,000 to 17,000 and for the week ending 17 March 1944 was reported at 16,535. The number of malaria cases under treatment has declined in recent weeks from a high of 2230 on 25 February 1944 to 2032 at the end of 17 March 1944; only 13 of the 2032 malaria cases presumably were acquired in the United States.

[†]ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREA.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 17 MARCH 1944

COMMENT ON CURRENT TRENDS (CONT'D)

The number of tuberculosis cases remaining under treatment was reported at 1095 as of 17 March 1944.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 17 March 1944 was reported at 381,500 or 800 less than at the end of the previous week. The number of beds occupied was about 162,000 or 3,000 less than at the end of the previous week, while the number of "available vacant" beds increased to 144,000. There were 14 stations with bed capacity of about 5,500 having no "available vacant" beds; one General Hospital (with a bed capacity of about 1,000) was included among these stations.

The number of normal beds reported declined slightly during the week and as of 17 March 1944 stood at about 297,000 or 78 percent of the total bed capacity. Whereas, since the beginning of the year total bed capacity has increased slightly by about 5 percent, normal bed capacity has decreased by more than 10 percent; these changes reflect chiefly differences in definition and reporting as a result of the use of the new Form 86ab (and the application of the recently issued AR 40-1080 and WD Circular No. 43) rather than any real changes in bed capacity.

Included in the normal bed capacity on 17 March 1944 were 9,940 beds in maneuver areas, while the total bed capacity included 10,891 such beds.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, rose to about 104,000 as of 17 March 1944. On the same date about 49,000 of these beds (or about one-half) were occupied. The "available vacant" beds at General Hospitals numbered 33,000 as of 17 March 1944, the highest figure thus far reported. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 212,000 as of 17 March 1944 for the reasons previously stated. Total beds occupied as of 17 March 1944 numbered 113,000 or about 41 percent of the corresponding total bed capacity. Station Hospitals had 111,000 "available vacant" beds as of 17 March 1944, the highest number yet reported.

As of 17 March 1944 the bed capacity of convalescent facilities in General Hospitals numbered about 10,000 beds of which about 4,000 beds were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 FEBRUARY 1944

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA

The data of this supplementary report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 25 February 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This supplementary report covers morbidity data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases. However neuropsychiatric admissions are not shown classified as between locked ward cases and other cases, as had been done in previous months, because the use by many stations of the revised Form 86ab rendered such information unavailable for all stations.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends from all causes, from disease, and from injury is presented on page 43. A summary of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 45 to 75. On pages 76 and 77 the six stations with the highest rates of admission during the four week period ending 25 February 1944 are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During the four week period ending 25 February 1944 morbidity from all causes was about 8 percent lower than during the first four weeks of January 1944. The annual admission rate from all causes for the four week period ending 25 February 1944 was reported at 778 per thousand strength or nearly 20 percent below that for February 1943. The annual admission rate from disease for the four week period ending 25 February 1944 was reported at 709 per thousand or 9 percent below the corresponding rate for the first four weeks of January 1944. The entire decrease in the admission rate for disease is accounted for by lower morbidity from colds, influenza, etc.

The admission rate from injury remained on the same low level as during the first four weeks of January 1944 and about 15 percent under the rate recorded for the corresponding period in 1943.

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Every Service Command reported lower morbidity during the four week period ending 25 February 1944, as compared with the first four weeks of January 1944. In general, the largest decreases in admission rates from all causes and from disease occurred in the Service Commands which experienced the largest declines in morbidity from colds, influenza, etc. The Seventh Service Command continued to report the highest admission rates from all causes and from disease - about 18 percent higher than for the country as a whole. The lowest admission rates from all causes and from disease - about 13 percent below those for the United States as a whole - were registered in the First Service Command.

Several Service Commands reported slightly higher admission rates from injury. The First, Seventh, and Third Service Commands experienced materially lower rates of admission from injury. The highest rates of admission from injury occurred in the Eighth Service Command (77 per thousand), in the Fourth Service Command (73 per thousand), and in the Ninth Service Command (69 per thousand), while the lowest admission rates were in the Military District of Washington (40 per thousand) and the Fifth Service Command (57 per thousand). In the other Service Commands, the admission rates from injury were in the range from 60 to 64 per thousand.

RESPIRATORY DISEASES

Morbidity from colds, influenza, etc. declined from 341 per thousand during the first four weeks of January to 271 per thousand in the succeeding four week period. This latter rate was about 30 percent below that for February 1943 and nearly 40 percent under the corresponding rate for February 1942. In general, the trend of the admission rate from colds and influenza during the four week period ending 25 February 1944 was downward.

All Service Commands showed lower morbidity from colds, influenza, etc. during the four week period ending 25 February 1944. The largest decreases in admission rates from colds, influenza, etc. were recorded in the Southern states (Fourth and Eighth Service Commands) and also in the Third and Ninth Service Commands. The Seventh Service Command continued to report the highest admission rate from these causes (about 65 percent higher than for the country as a whole), while the lowest rate was registered in the Eighth Service Command (almost 25 percent under the rate for the country as a whole).

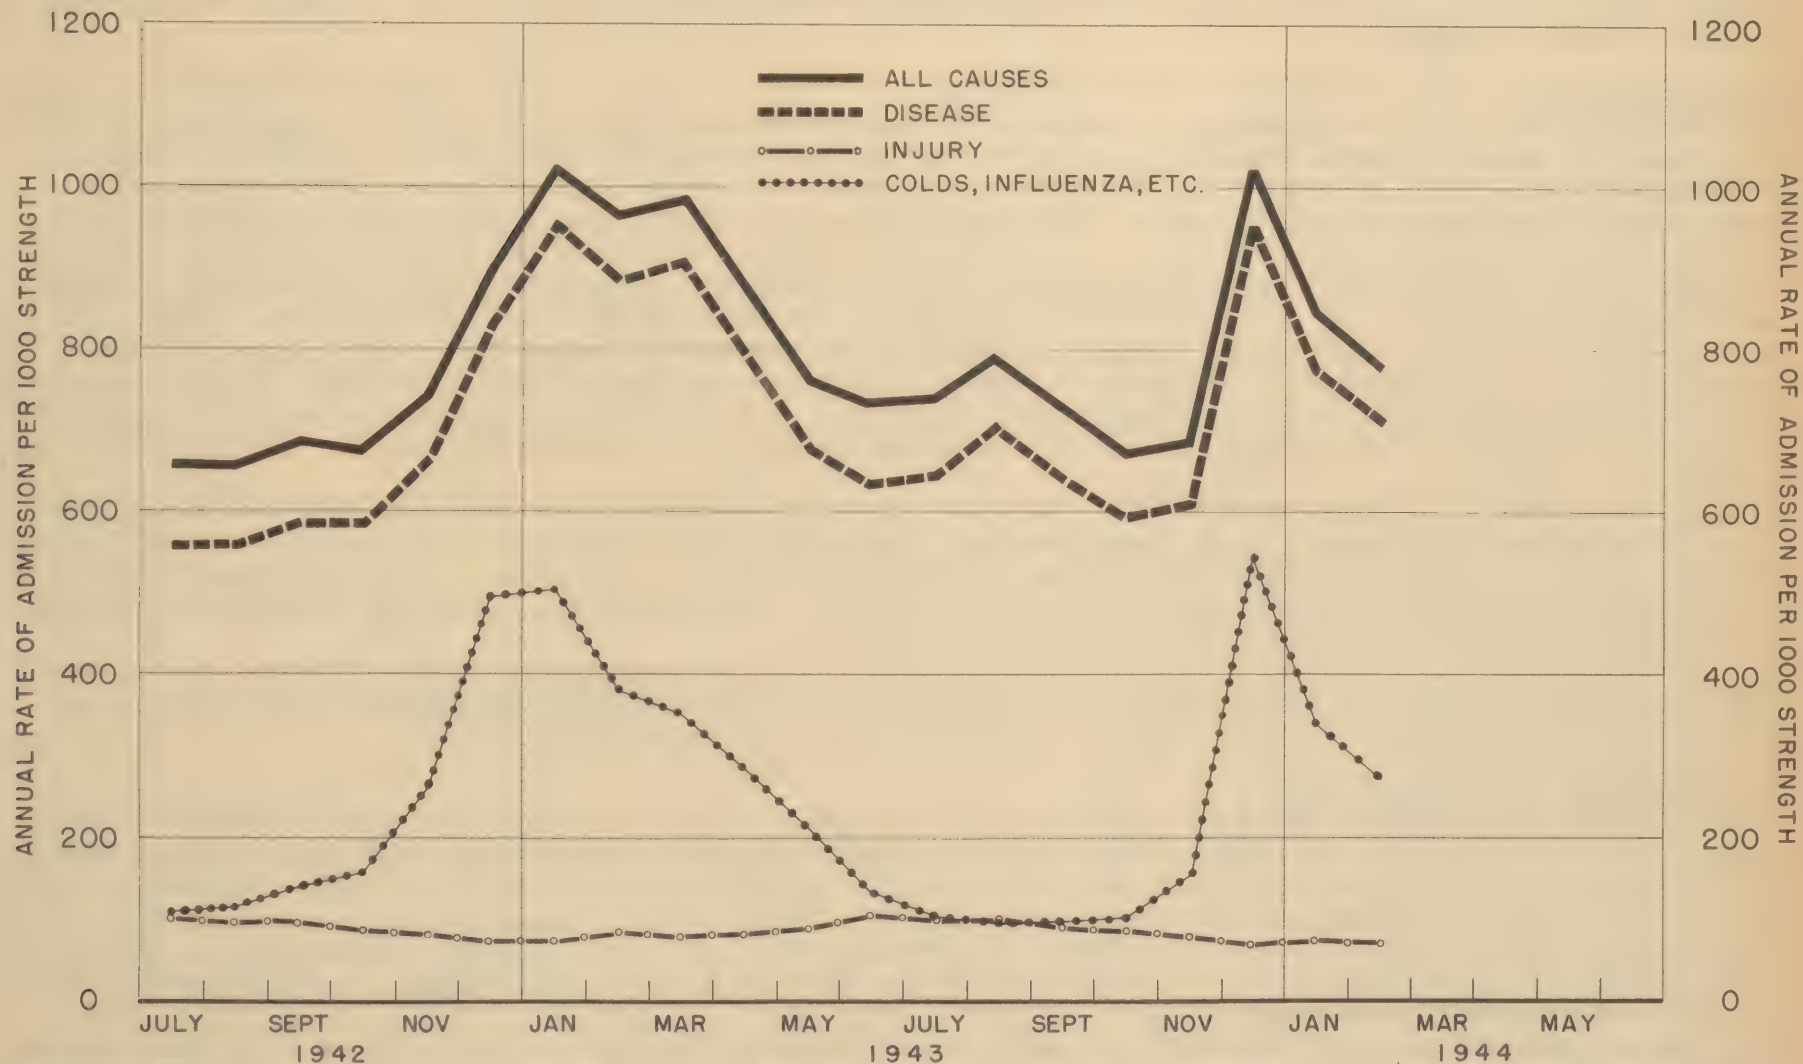

Morbidity from all forms of pneumonia declined about 10 percent for the United States as a whole. The annual admission rate of 19.9 per thousand reported for the four week period ending 25 February 1944 was more than 15 percent below the corresponding rate for February 1943. Atypical pneumonia accounted for about 55 percent of the total pneumonia admissions or a somewhat higher percentage than for the first four weeks of January 1944. The Seventh Service Command continued to report by far the highest morbidity from pneumonia, reflecting in part a continued high admission rate from this cause at Jefferson Barracks, Mo. The lowest admission rate from pneumonia was again reported by the Ninth Service Command. The proportion of cases diagnosed as atypical pneumonia was highest in the First and Third Service Commands.

DIARRHEA AND DYSENTERY

Admissions from diarrhea and dysentery continued at the same rate (9.0 per year per thousand) during the four week period ending 25 February 1944 as during the preceding two months. This rate was, however, about 80

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

percent higher than the rate for February 1943. The Fifth Service Command continued to report the highest admission rate from this cause (14.8 per thousand), while the lowest morbidity (6.8 per thousand) was reported by the Sixth Service Command.

VENEREAL DISEASE

Morbidity from venereal disease, excluding EPTI cases, decreased from about 30 per thousand during the first four weeks of January 1944 to 27.6 per thousand during the succeeding four week period. This rate remains nevertheless quite high, in comparison with past experience. The Fifth Service Command which reported the highest morbidity from venereal diseases (excluding EPTI cases) during January 1944, showed a sharp drop in the admission rate from these causes during the following four weeks. The Sixth and Ninth Service Commands also reported substantial decreases in morbidity from venereal diseases. Small increases in morbidity from these causes were registered in the First Service Command and in the Military District of Washington. The Second Service Command reported the highest morbidity from venereal disease excluding EPTI cases (42 per thousand) for February 1944; in this connection it should be borne in mind however that a large proportion of such new venereal cases were among task force troops not under the jurisdiction of that Service Command. As in previous months, the Military District of Washington and the First Service Command both experienced very low morbidity from these causes.

Morbidity represented by venereal EPTI cases was reported at about 25 per year per thousand during February 1944. This is somewhat lower than in recent months. Variations in the admission rate for venereal EPTI cases from one Service Command to another have little significance, because they reflect, inter alia, a different geographical distribution of Army personnel relative to that of new inductees, different proportions of white and colored inductees, and varying administrative practices.

Morbidity from all venereal diseases, including EPTI cases, was reported at 52 per thousand during the four week period ending 25 February 1944. With two exceptions (January 1944 and November 1943) this is the highest rate of morbidity from these causes registered in at least a decade.

MEASLES, MUMPS AND SCARLET FEVER

Morbidity from measles, mumps, and scarlet fever continued to show the expected seasonal sharp upward trend. The admission rate from measles was about 75 percent higher during the four week period ending 25 February 1944 than during the preceding four week period, while the corresponding rates for mumps and scarlet fever increased by about 70 percent and 15 percent respectively. Nevertheless the morbidity from measles in February 1944 was only about a third of that experienced in February 1943, and morbidity from mumps was less than half that experienced in February 1943. Scarlet fever on the other hand showed an incidence in February 1944 about 40 percent higher than in February 1943.

The largest increases in morbidity from measles were reported from the Seventh, Eighth, and Fifth Service Commands, with the highest incidence continuing in the Fourth and Seventh Service Commands. The largest increases in morbidity from mumps occurred in the Military District of Washington and the Sixth Service Command, but the highest incidence was reported from the Third Service Command and the Military District of Washington.

ARMY SERVICE FORCES
OFFICE OF THE SURGEON GENERAL
MEDICAL STATISTICS DIVISION

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The largest increases in morbidity from scarlet fever were again registered in the Sixth and Seventh Service Commands, which also continued to have the highest admission rates.

MENINGITIS

The admission rate from meningitis increased slightly and for the four week period ending 25 February 1944 was reported at about 1.1 per thousand. This is less than half the rate reported from this cause in February 1943 and only about 35 percent of the peak rate for 1943 reached in March of that year. The highest incidence of meningitis was in the Second Service Command which reported a rate about 50 percent higher than that for the country as a whole.

RHEUMATIC FEVER

Morbidity from rheumatic fever was reported at 1.8 per thousand for the four week period ending 25 February 1944. This admission rate was about 30 percent higher than that experienced during the preceding four weeks, and nearly three times as high as that reported for February 1943, but 25 percent below the peak rate for 1943 registered in April of that year. The largest increases in morbidity from rheumatic fever occurred in the Seventh and Sixth Service Commands. As for some time past, the Seventh Service Command continued to report by far the highest admission rate from rheumatic fever (8.8 per year per thousand.)

TUBERCULOSIS

Morbidity from this cause showed no change from the very low rate of 1.0 per year per thousand recorded in January 1944. The lowest admission rate reported from this cause during the past two years was .9 per thousand in December 1943. The variations by Service Command in the admission rate from tuberculosis do not appear to be very significant.

MALARIA

Morbidity from malaria acquired in the United States continued at the very low rate of .1 per year per thousand. On the other hand, malaria presumably acquired outside of the United States showed an admission rate of 3.1 per thousand or close to the highest rate recorded, for January 1944. The sharp increase in 1943 in the admission rate for malaria acquired overseas reflects the increasing number of troops returning to the United States from malarious areas. Whereas the largest numbers of cases of malaria acquired in the United States have usually been reported from the Southern states, the cases of malaria acquired overseas are more uniformly distributed geographically.

NEUROPSYCHIATRIC DISORDERS

The rate of admission for neuropsychiatric disorders increased slightly to 27.2 per thousand for the four week period ending 25 February 1944. This rate is still considerably below the high admission rates recorded for the months of July through October 1943 when special efforts were made to detect neuropsychiatric disorders, particularly in connection with the reconsideration of the medical fitness of limited service men.

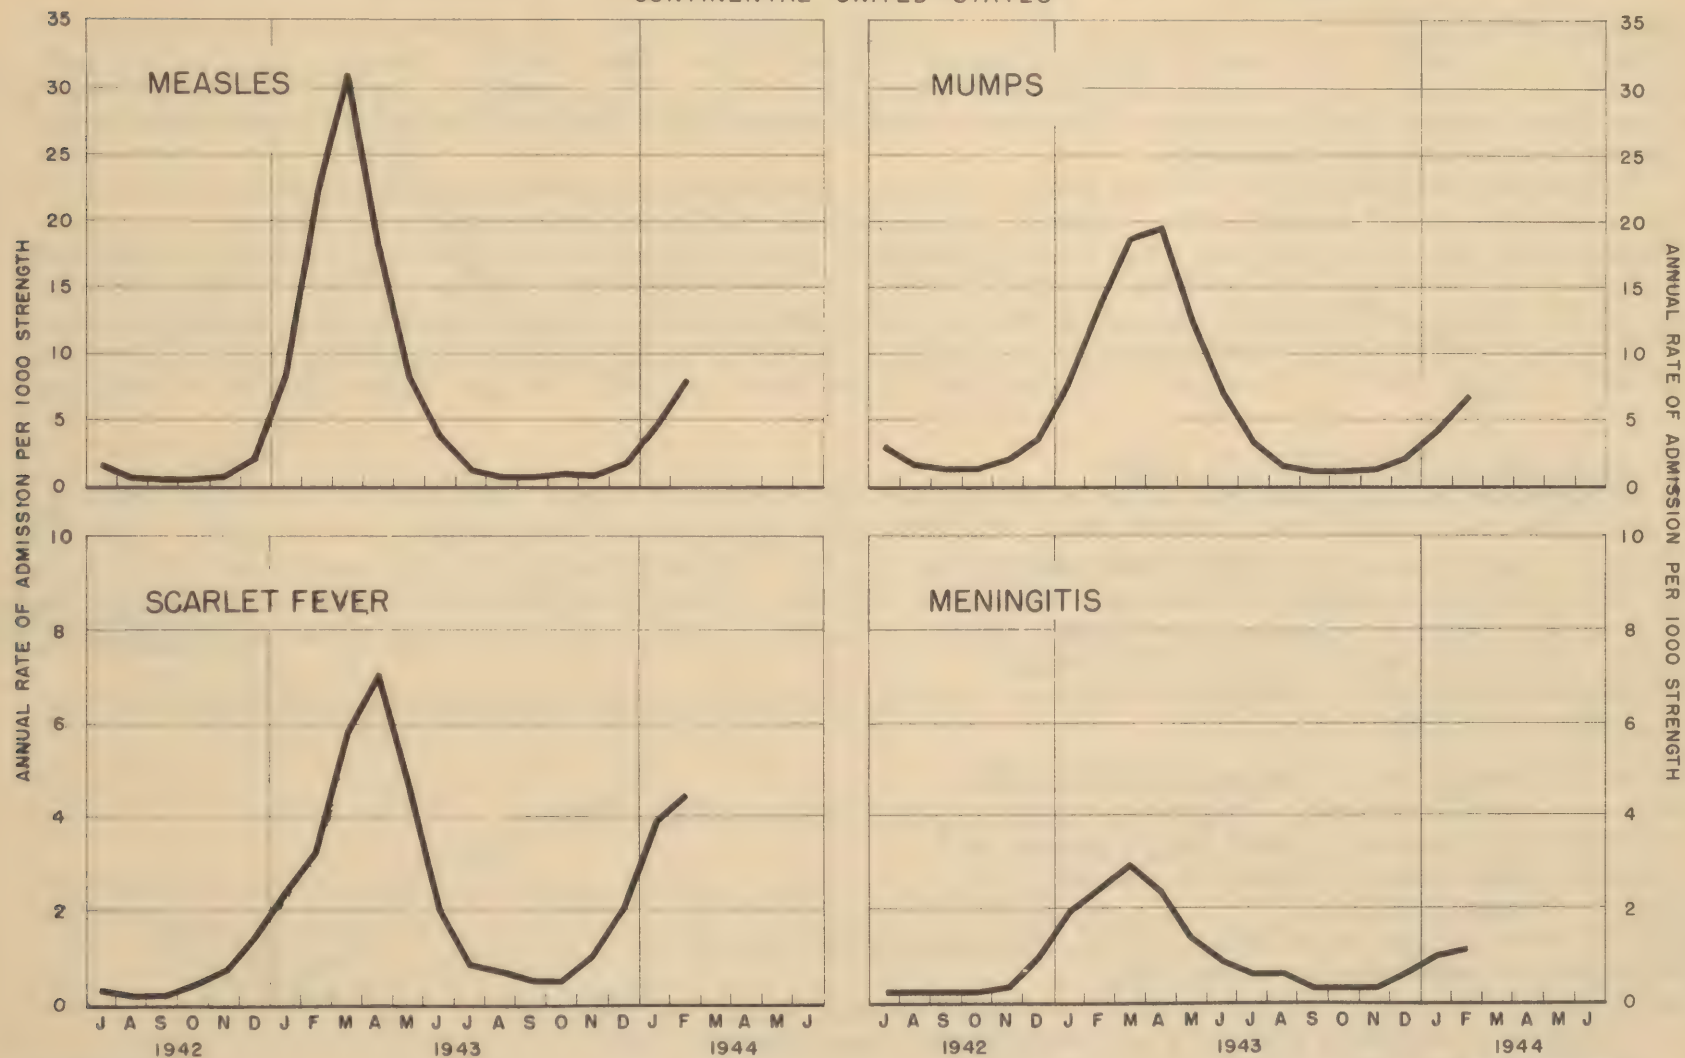

The admission rate from neuropsychiatric disorders declined in the First, Second and Third Service Commands

SCARLET FEVER—MENINGITIS

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

and increased materially in the Seventh and Fifth Service Commands as well as in the Military District of Washington. As a result, the Seventh Service Command displaced the Second Service Command (with a rate of nearly 47 per year per thousand) as the Command with the highest morbidity from neuropsychiatric disorders. The lowest rates from these causes were reported by the First Service Command and the Military District of Washington (both about 19 per year per thousand).

The number of neuropsychiatric cases remaining under treatment on 25 February 1944 rose to 16,826 or about 5 percent more than on 28 January 1944. Most of this increase was reported in open ward cases.

Attention is called to the fact that neuropsychiatric admission rates were recently revised on the basis of a study made from December 1943 reports. An explanation of the reasons for and the nature of this revision was included in the Supplemental Health Report attached to the Weekly Health Report for the week ending 21 January 1944. It will be noted that the neuropsychiatric admission rate for the four week period ending 25 February 1944 as well as that for the preceding four week period are both in line with the revised series of admission rates.

STATIONS WITH THE HIGHEST MORBIDITY RATES

As in previous months there was a large proportion of reception centers (Presidio of Monterey, Calif., Camp Upton, N.Y., New Cumberland, Pa.) and of small stations (New York General Dispensary; Ft. Ontario, N.Y.; Wash. State College, Wash.) among the stations reporting the highest admission rates from all causes and from disease for the four week period ending 25 February 1944. In the case of the reception centers the high morbidity was primarily attributable to venereal EPTI cases, while in the case of the small stations relatively high morbidity from colds, influenza, etc. was largely to blame.

The following stations continued to report very high admission rates from the indicated causes for the third consecutive report period.

Colds, influenza, etc. - Greensboro, N.C. BTC

Pneumonia (incl Atypical) - Jefferson Barracks, Mo., Sioux Falls, S.D.

Diarrhea and Dysentery - West Point Cadets, N.Y.

Measles - Camp Fannin, Texas, Ft. Benning, Ga.

Mumps - Freeman AAF, Ind.

Scarlet Fever - Cincinnati Univ., Ohio, Pittsburg Univ., Pa. ASTU

Meningitis - Jefferson Barracks, Mo.

All Venereal Diseases (excluding EPTI) - Camp Forrest, Tenn., Ft. Jay, N.Y.

Syphilis (excluding EPTI) - Ft. Clark, Texas, Camp Forrest, Tenn.

Gonorrhea (excluding EPTI) - Ft. Jay, N.Y.

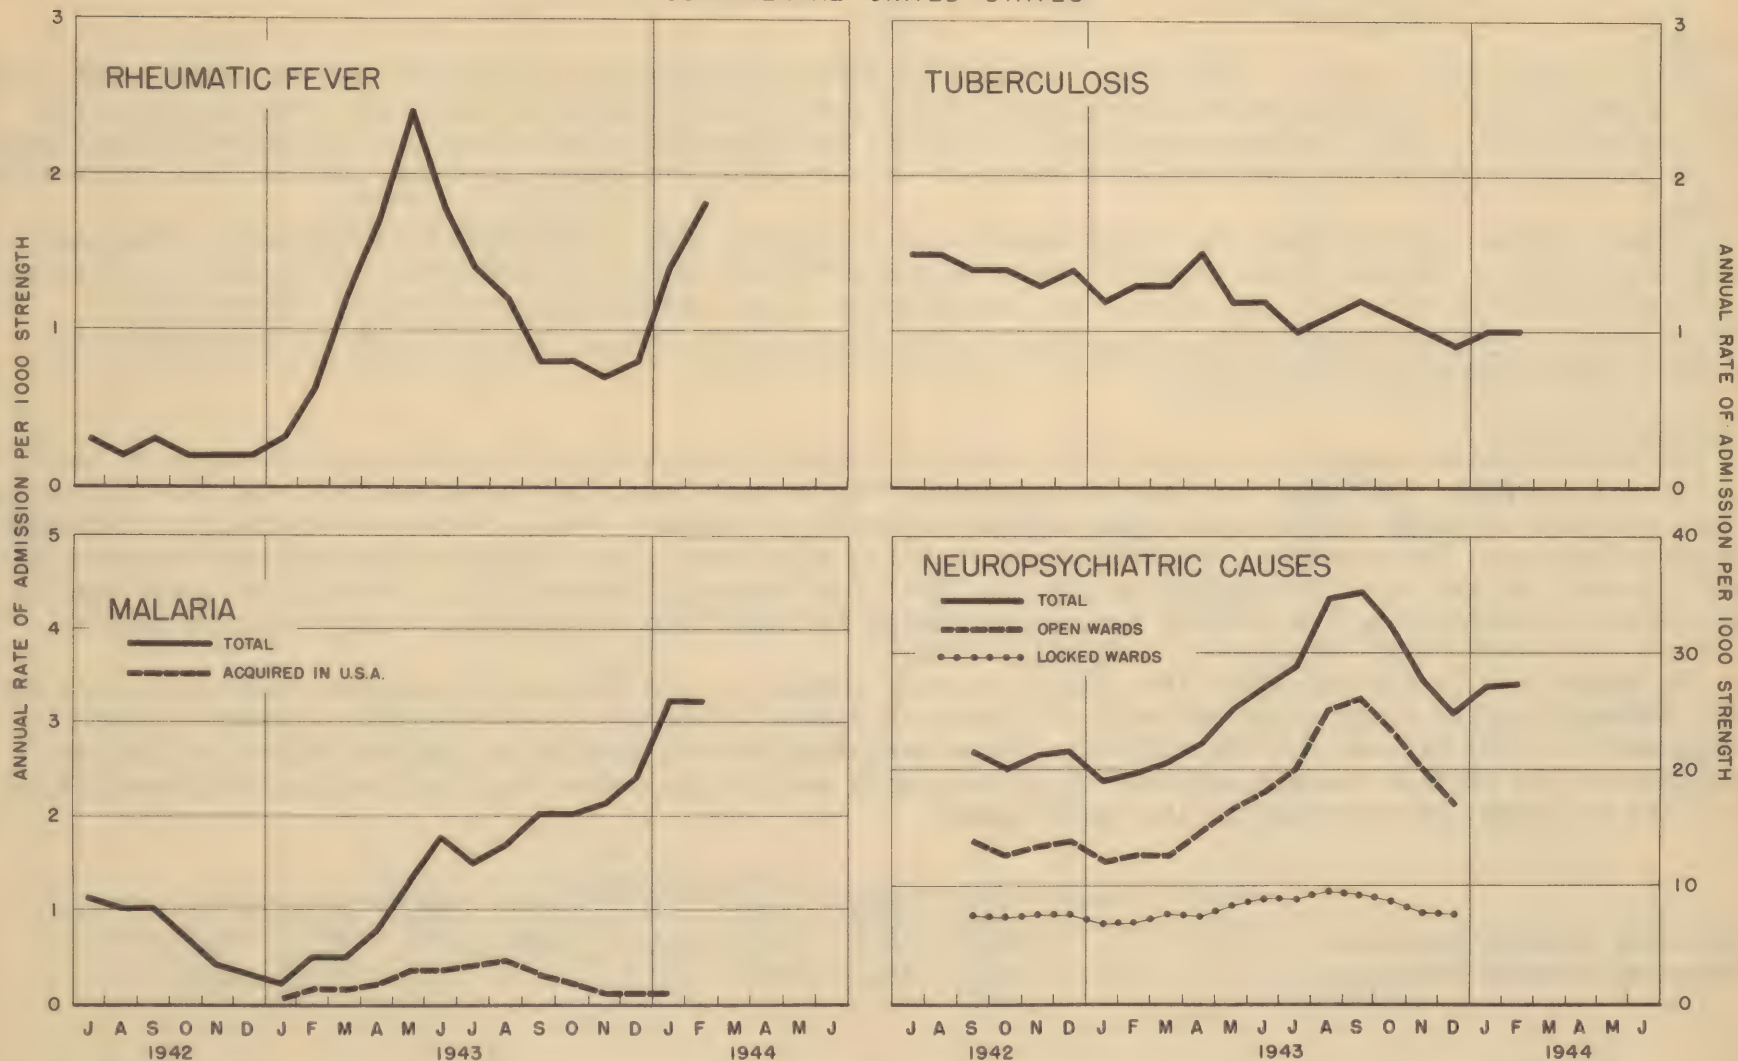

Other Venereal Diseases (excluding EPTI) - Ft. Clark, Texas, Camp Sibert, Ala.

Rheumatic Fever - Buckley Field, Colo., Camp Kearns, Utah

Injuries - West Point Cadets, N.Y.

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY

The mortality rate from all causes was reported at 2.38 per year per thousand for the four week period ending 25 February 1944. Diseases were responsible for .58 deaths per thousand or about the same as during the preceding two months, Injuries accounted for 1.80 deaths per thousand, a rate considerably below the peak rate of 2.06 per 1000 reported for the first four weeks of January 1944, but above the rates for the last two months of 1943.

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Readers are cautioned not to use the death rates from injury or the death rates from all causes shown in this report as accurate indications of mortality rates.

NON-EFFECTIVE RATE

The non-effective rate for the first four weeks of February 1944 was 39.8 per thousand strength or about the same for January 1944. For the four week period ending 25 February 1944, the non-effective rate from injury was 7.3 per thousand strength or about the same as that reported for January 1944. It is noteworthy that injuries accounted for almost 20 percent of the total non-effective rate even though injury admissions represented only about 9 percent of the total admissions during the first four weeks of February 1944. Part of this difference arises from the relatively high rate of admissions during February from respiratory causes which in most instances had a very short duration of hospitalization.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included, as evidenced in the table below:

	Service Command									
	I	II	III	MDW	IV	V	VI	VII	VIII	IX
Including General Hospitals	28.3	42.7	41.6	64.7	36.2	51.2	40.7	47.4	37.3	39.9
Excluding General Hospitals	23.1	23.9	30.4	26.7	27.2	25.8	29.7	34.2	25.4	29.4
